	Very unlikely	Unlikely	Somewhat likely	Likely	Very likely

# National risk assessment Netherlands

## Pandemic & Flood

- Low Frequent
- Catastrophic impact
- Also other floods and pandemics are possible

		Very unlikely	Unlikely	Somewhat likely
Catastrophic			 <p>Sea flood (worst case)</p>	 <p>Virus from human to human</p>
	Very serious	<ul style="list-style-type: none"> <li>• IS seizes power in Morocco</li> <li>• Deployment of nuclear weapons in the Iran and Saudi Arabia conflict</li> <li>• Induced earthquake</li> </ul>	<ul style="list-style-type: none"> <li>• Chain effects of a power outage</li> <li>• Reunification of China and Taiwan</li> <li>• Temporary occupation of an EU Member State</li> </ul>	<ul style="list-style-type: none"> <li>• River flood </li> <li>• Flu pandemic </li> <li>• Collapse of the Venezuelan state</li> <li>• Disintegration of NATO</li> <li>• Systemic actor in the finance sector facing great difficulty</li> </ul>

# Different causes of flooding

- Sea (storm surge) (A,B)
- Rivers (extreme discharge) (A,B)
- Rainfall
  - Regional levees (C)
  - Large scale events (D)
  - Local thunderstorms (P)

> 1000 Possible scenario (LIWO)

Large scale rainfall

Pluvial

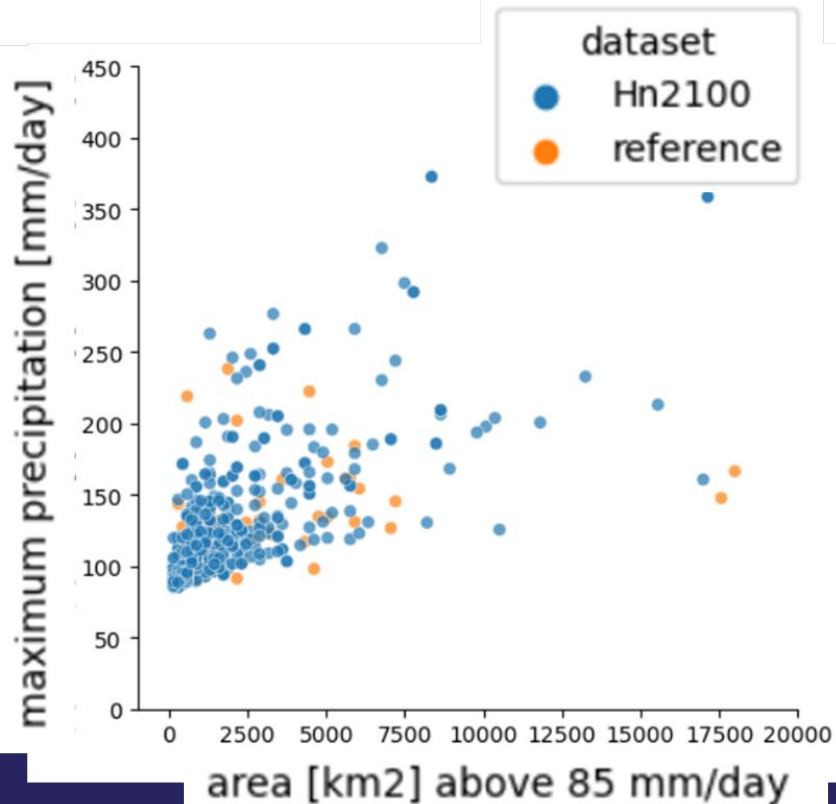

# Climate change

## Extreme rainfall

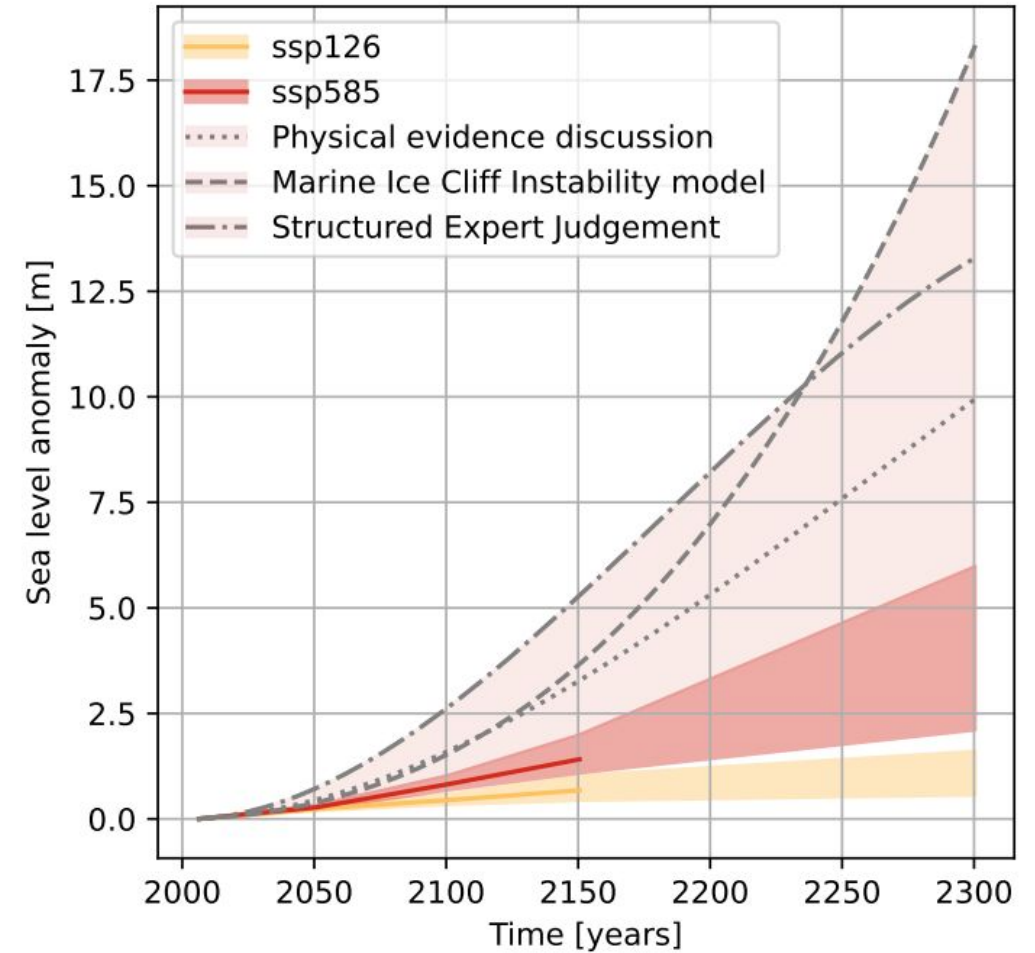

Statistics for a location in NL based on KNMI  
2023 'High' (meteobase.nl)

- 1Hour 2025: 58mm, 2100: 71 mm
- 4Day 2025: 128 mm, 2100: 144 mm

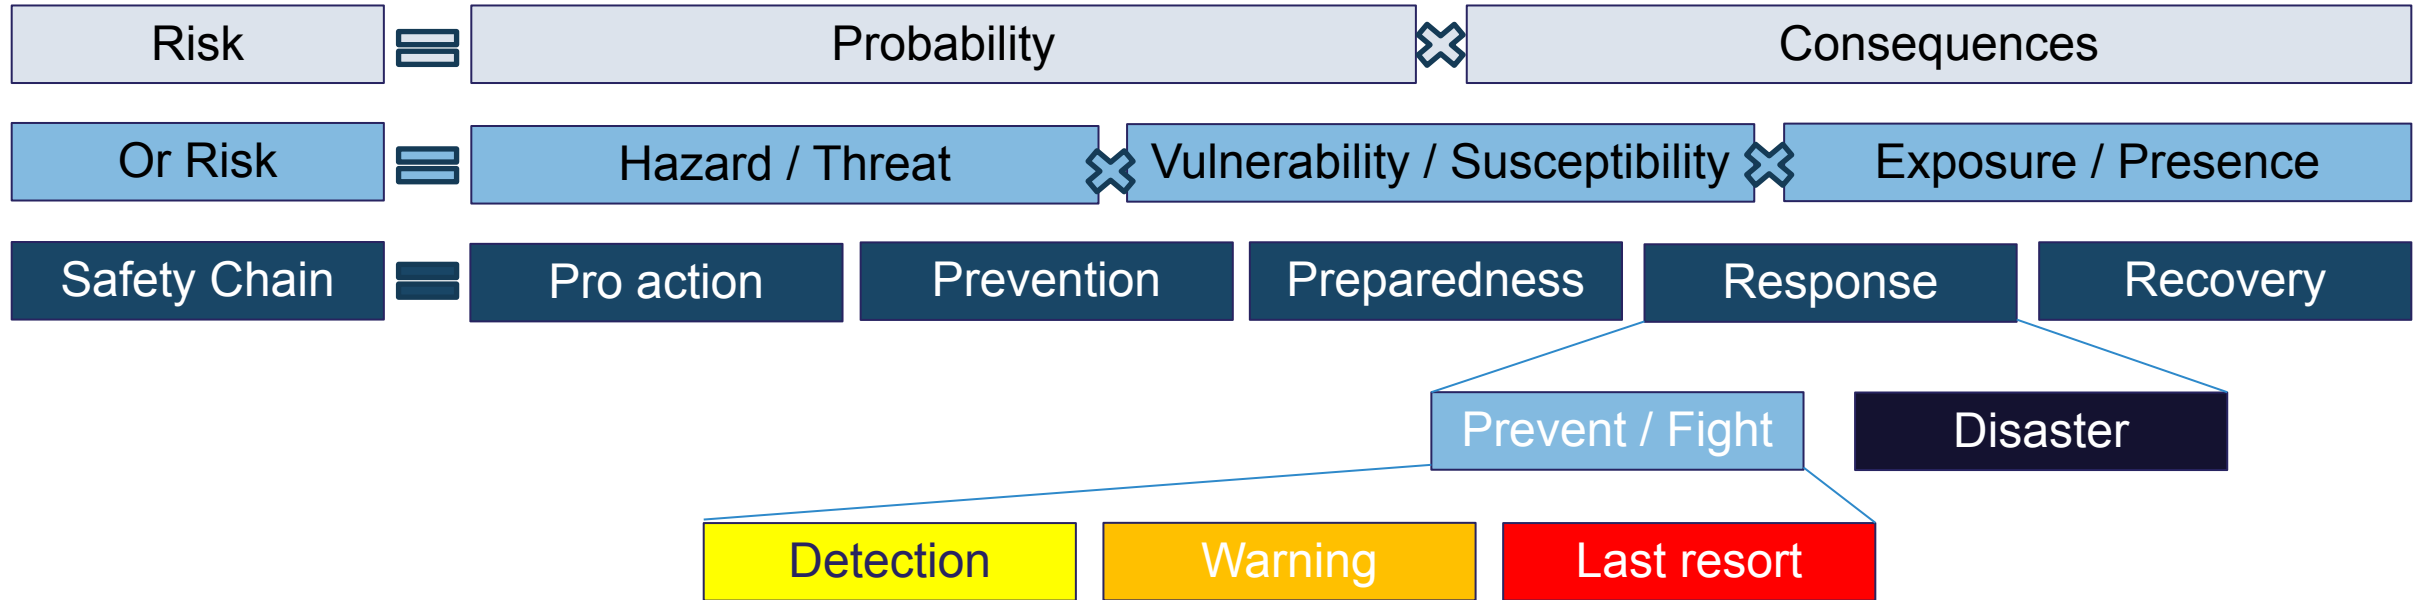

2025: New extreme –  
large scale scenarios

## Possible scenarios for Sea Level Rise (SLR)

# Risk perspective

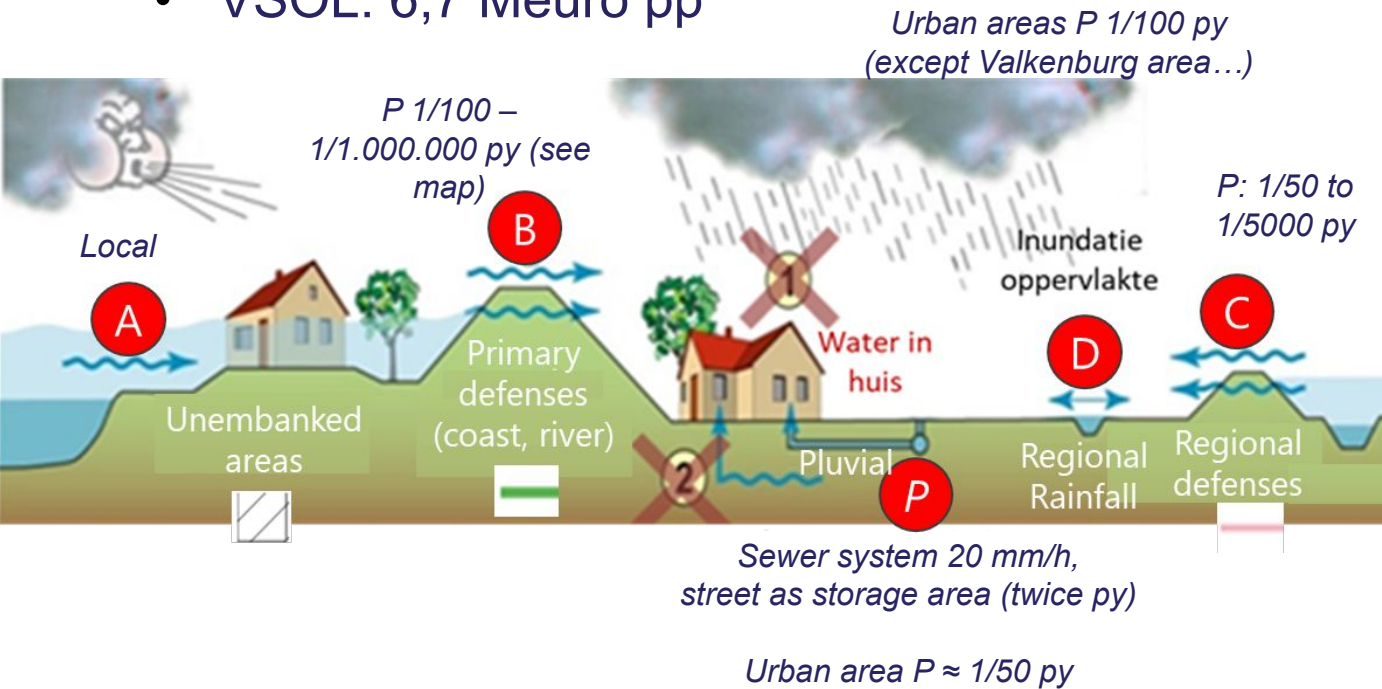

- Flood or Pandemic event: no society is designed to deal with the consequences
- The risk is never zero, the 'precautious principle' does not apply
- Societies already accept risks (eg individual risk of  $10^{-6}$  per year in external safety)

# Flood: Safety standards

(layer probability / prevention)

- Using SCBA
- VSOL: 6,7 Meuro pp

# Pandemic

(layer probability / prevention)

Hospitals capacity

Ventilation in buildings

Sewer system

QALY (quality adjusted life year)  
- €80.000 per year for a healthy person

# Time line Flood event (1)

Water management & levees

Forecasting systems

Land use planning

Monitor water levels

Forecasts for weather and water levels

Detection potential threat

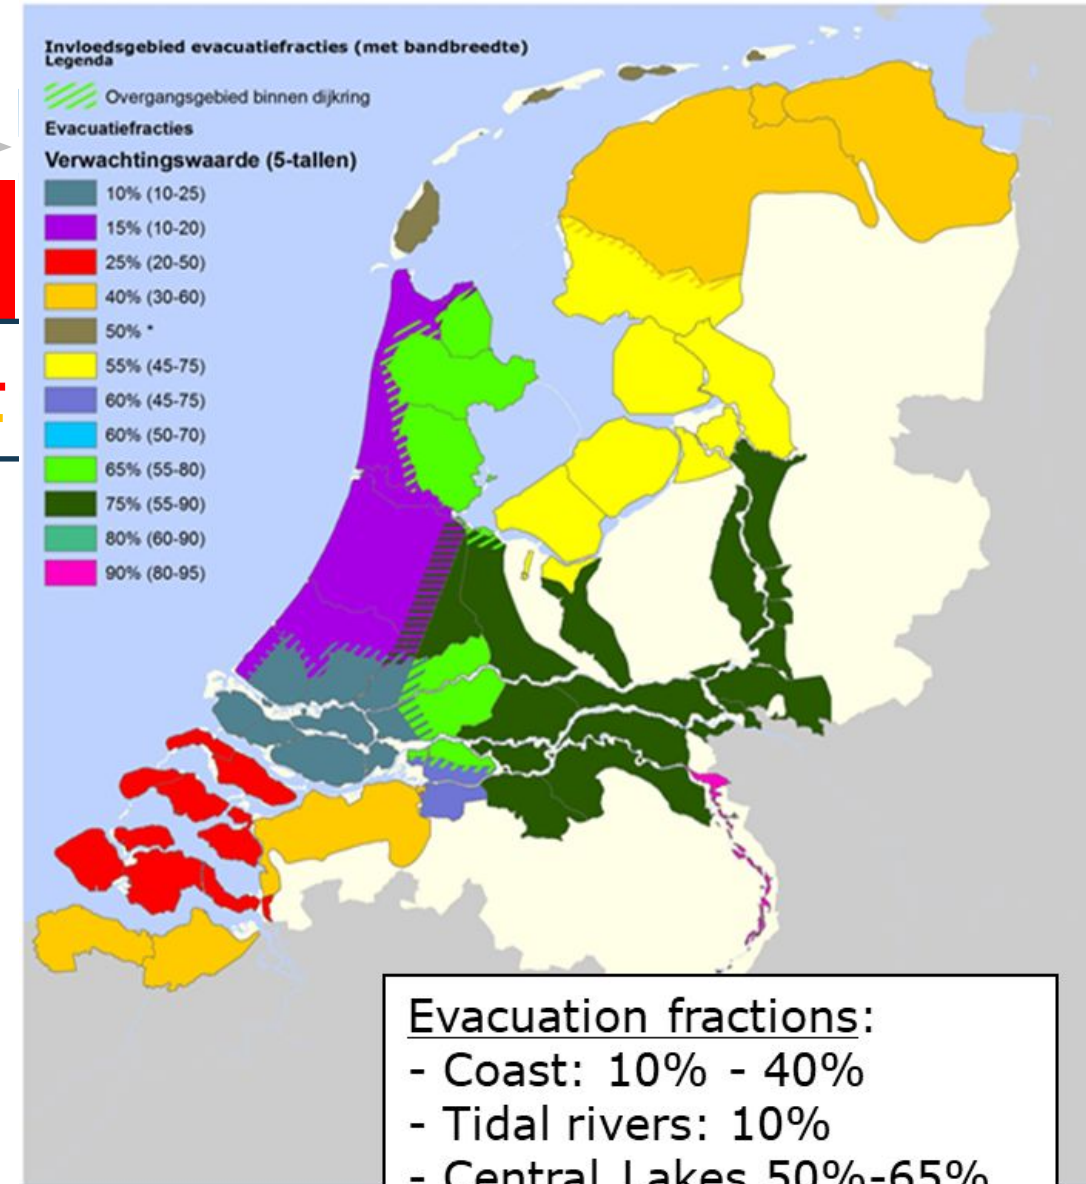

Warn public

Mobile flood barriers

Remove cattle in unembanked areas

To avoid loss of life

Prior to a flood

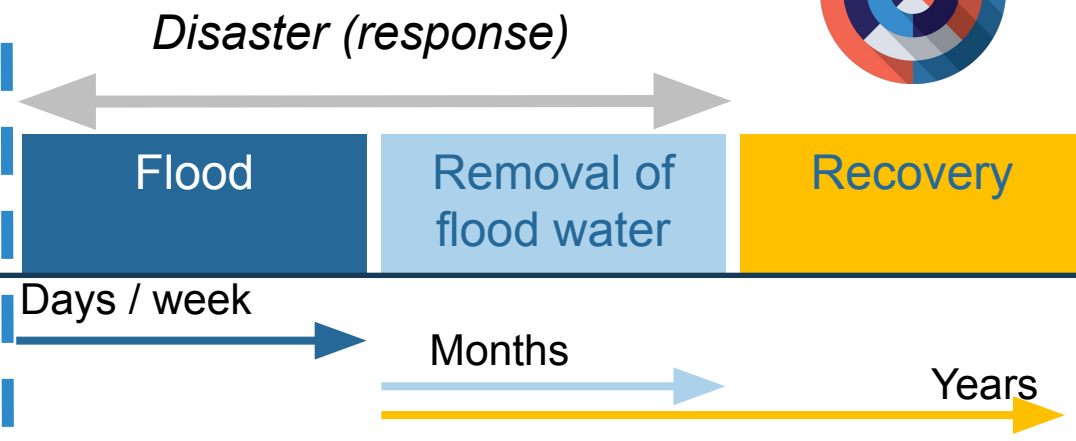

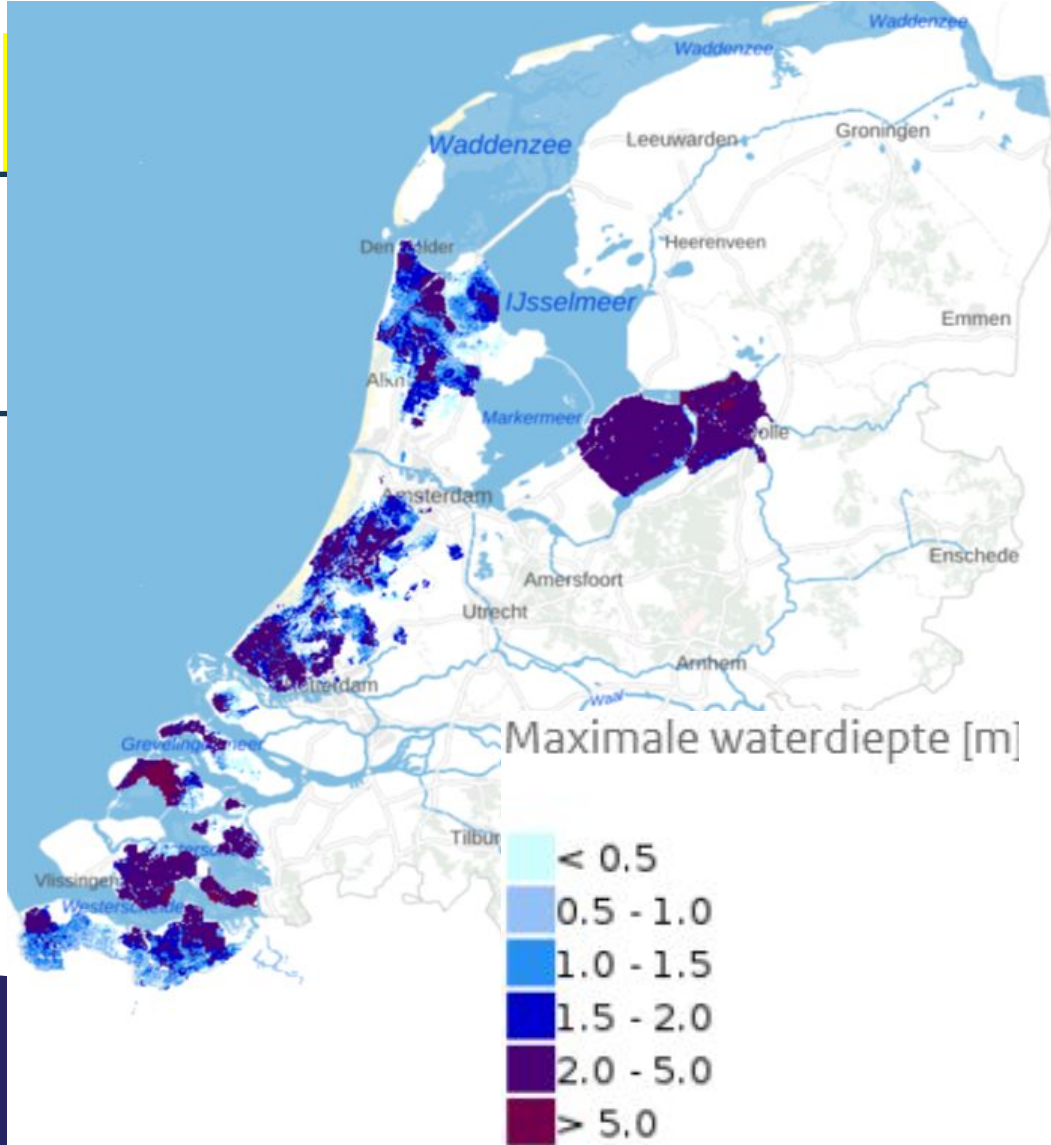

# Time line Flood event (2)

Normal day to day life

Timeline

<p><i>Worst Credible Flood</i></p> <ul style="list-style-type: none"> <li>• <i>Damage: 121 Billion € (2006)</i></li> <li>• <i>Loss of life &gt;10.000 people</i></li> </ul> <p>Breach of levee Start of flood</p>	<p>Close breaches</p> <p>Pumping water out</p>	<p>Damage compensation</p> <p>Reconstruction</p> <p>Social aspects</p>
---	--	--

# Flood & Pandemic

*Prevent & Fight (response)*

Normal day to day life

Detection and forecast

Warning and fighting

Last resort:

T=0

3-7 days

1-3 days

Preventive evacuation

T=0

3-4 months

1 month

Smart lockdown

## Similarities

- Low frequent events
- No to limited data / experience => uncertainty (will reduce over time)
- Early warning
- Risk trade-offs in:

A. Normal life (levees, IC, medicine)

B. Crisis (accept some costs to prevent possible worse)

C. No decision is also a decision

## Differences

- Duration
- Type of measures

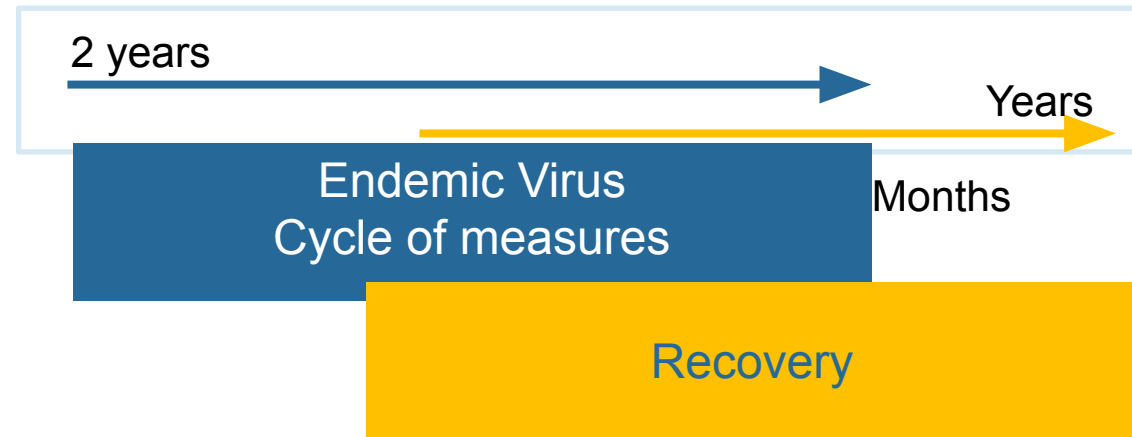

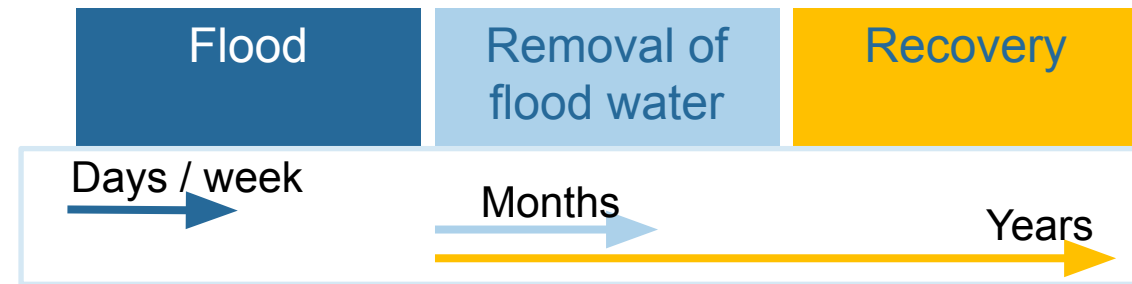

# Flood & Pandemic

## Similarities

- High Impact and long recovery
- Damage compensation / Insurance

## Differences

- Duration
- Pandemic: Real time data collection => over time data improve,  
But: the virus will change as measures and perceptions ...

What are similarities between a pandemic and flood?

# Woordwolk

What can (or should) an actuary add to crisis teams during the start of pandemic (until the virus becomes endemic) or a flood (before the levee fails)?

*If the measures is specific for a pandemic or a flood please mention this.*

# Woordwolk

What can (or should) an actuary add to crisis teams from the endemic phase of a pandemic or in the recovery phase of a flood?

*If the measures is specific for a pandemic or a flood please mention this.*

# Challenges and opportunities for actuary in response and recovery

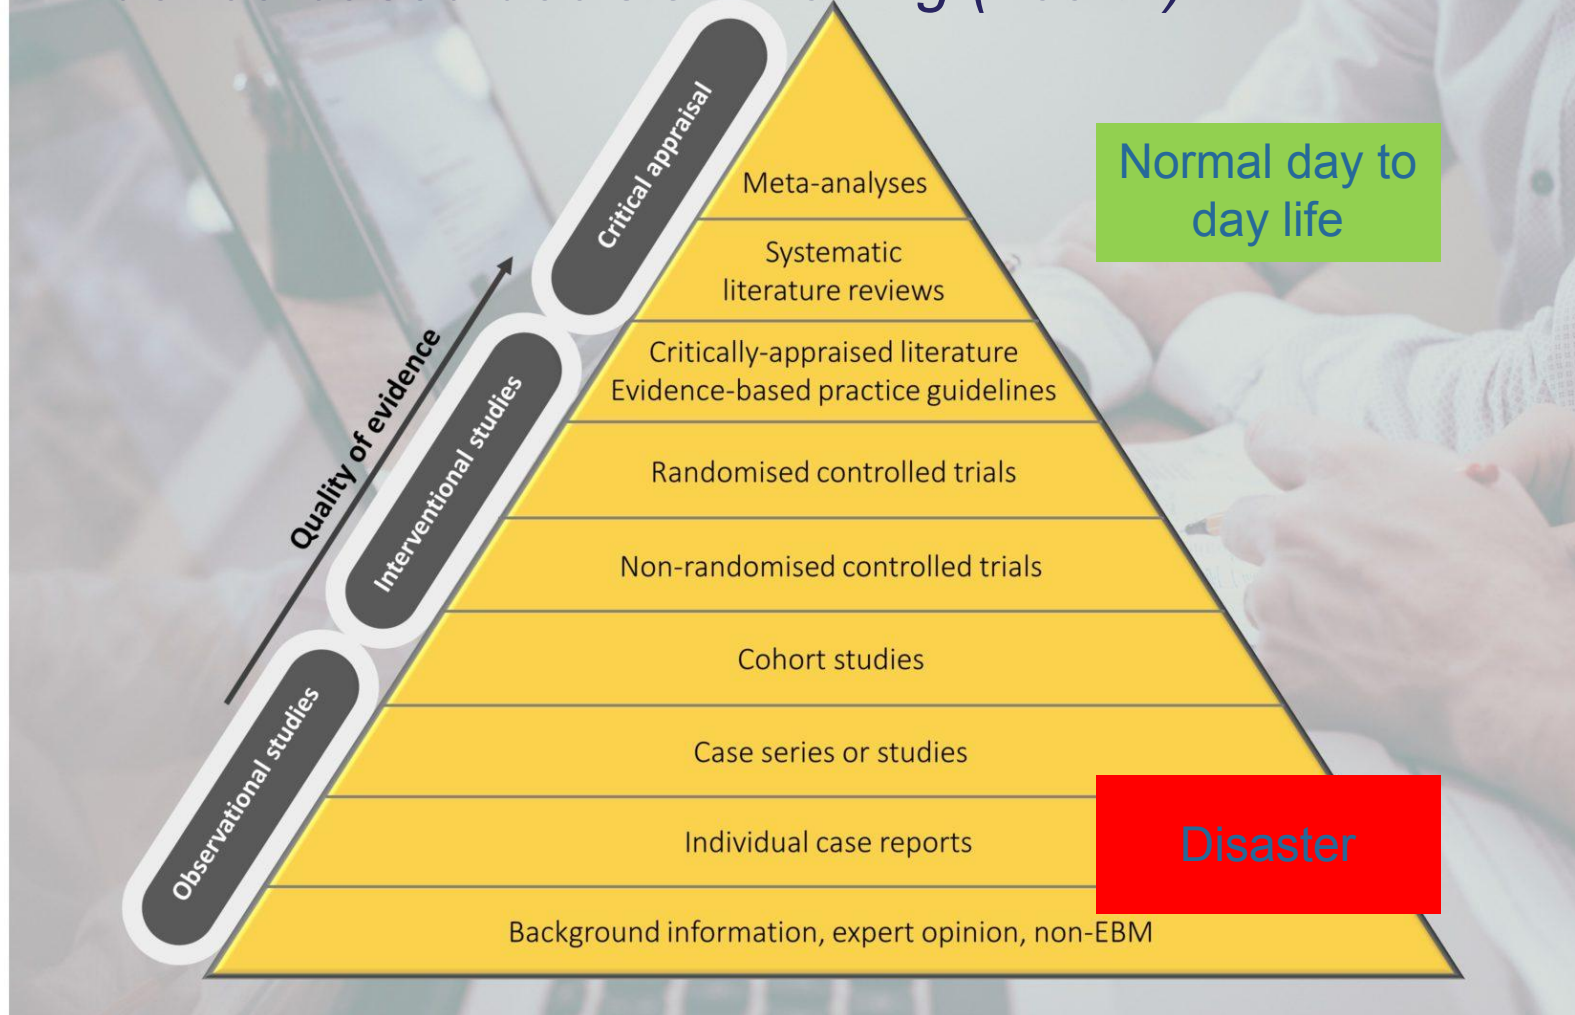

Challenge: limited data (health, climate), uncertainty, decisions are made anyway

Added value:

1. Risk expertise focusing on the
  - Order of magnitude of risk (economic, loss of life, ...)
  - Identify (not) important components of risk
2. Damage compensation during disasters
3. Building back better

## *Evidence based decision making (health)*

# Example: (Covid-19) Risk taxation model for Field Lab events

Can we reduce the infection risk at an event (per hour) so it is less than 'at home'?

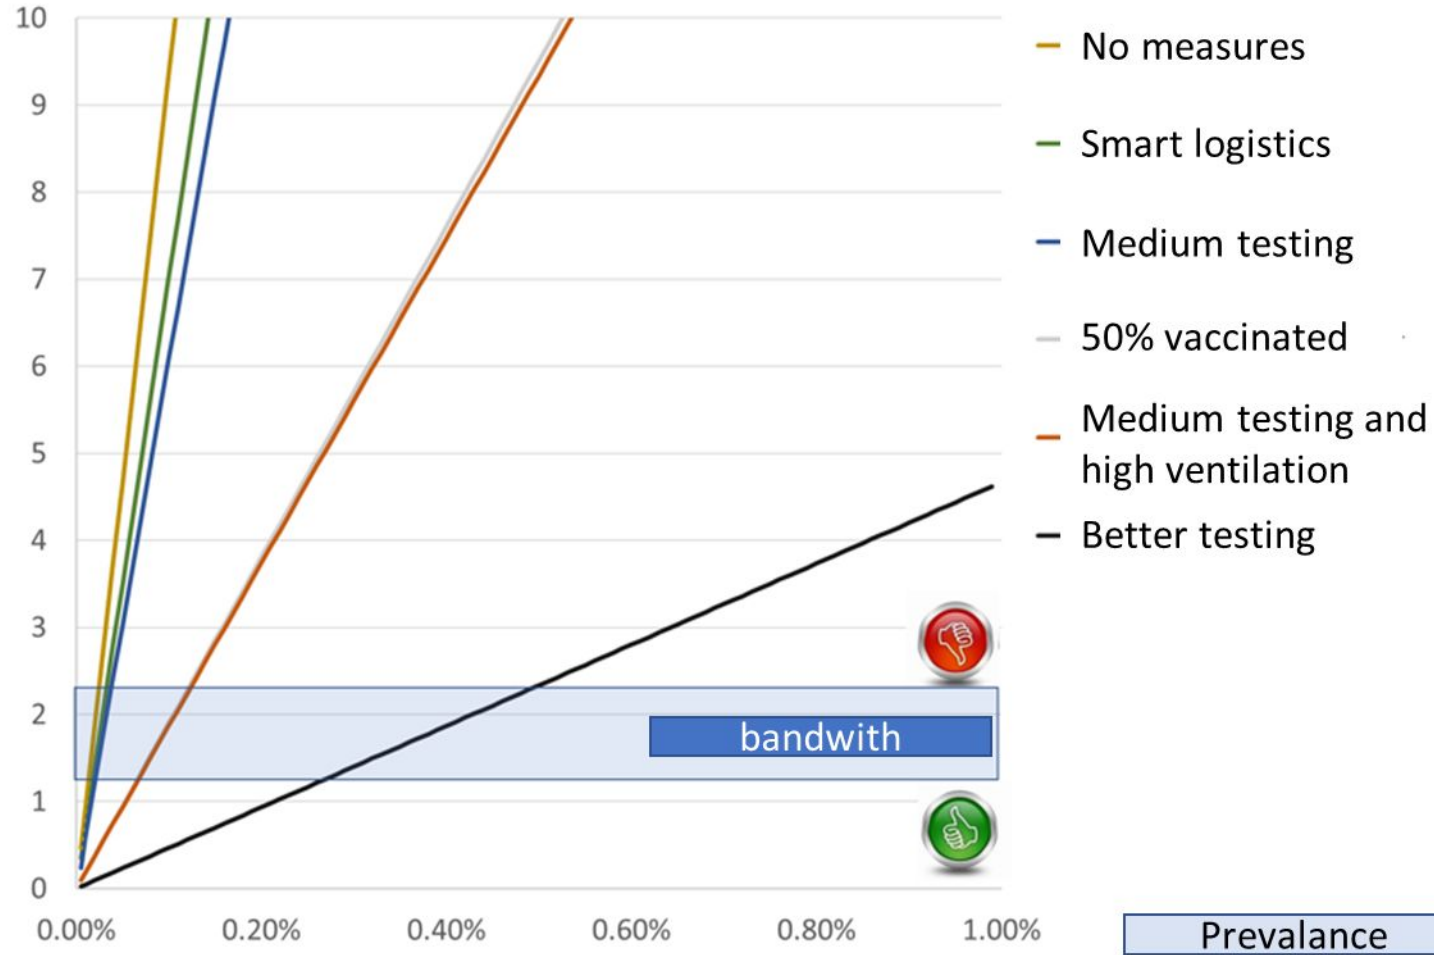

# (Covid-19) Risk taxation model for Field Lab events based on risk modeling

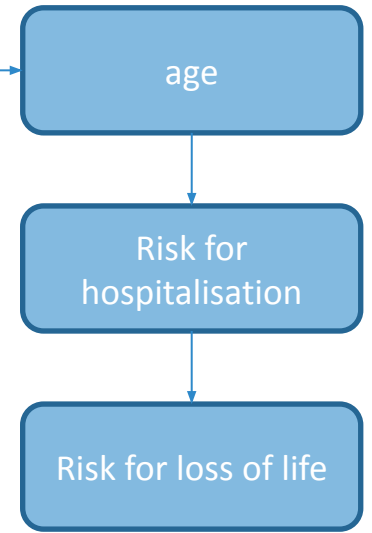

<https://www.medrxiv.org/content/10.1101/2022.01.10.21268254v2.full.pdf>

risk for infection per 100.000 persons

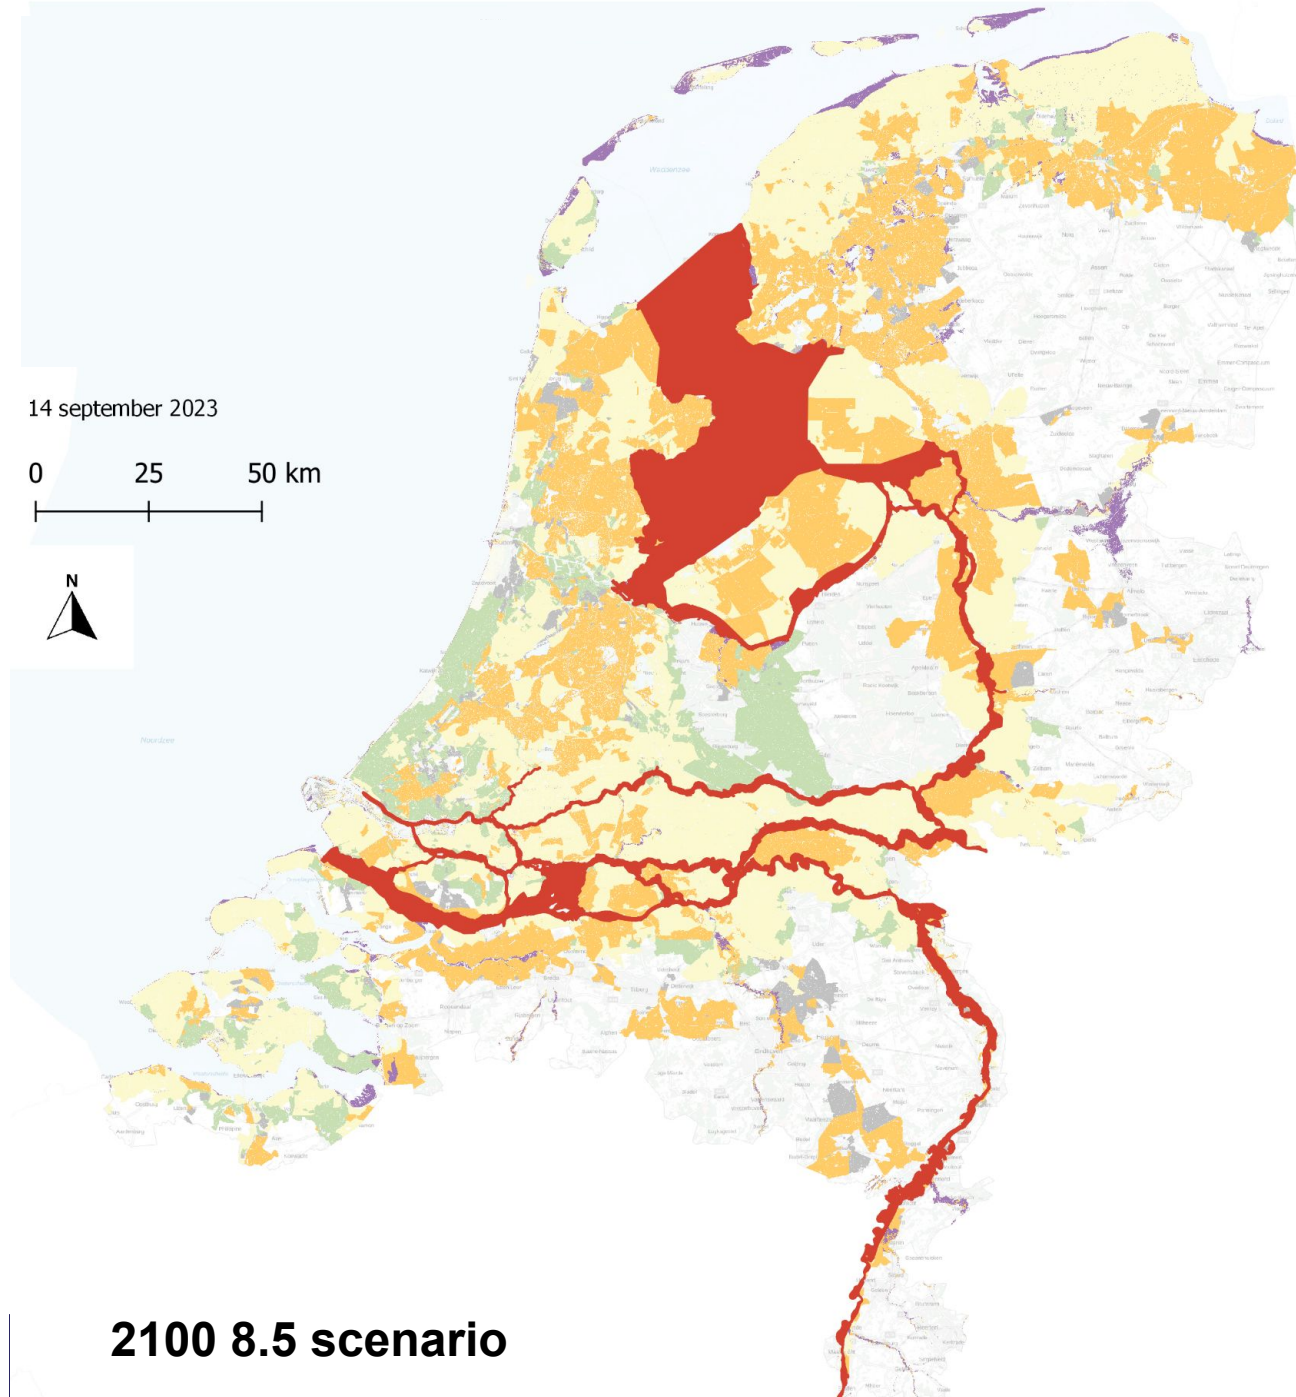

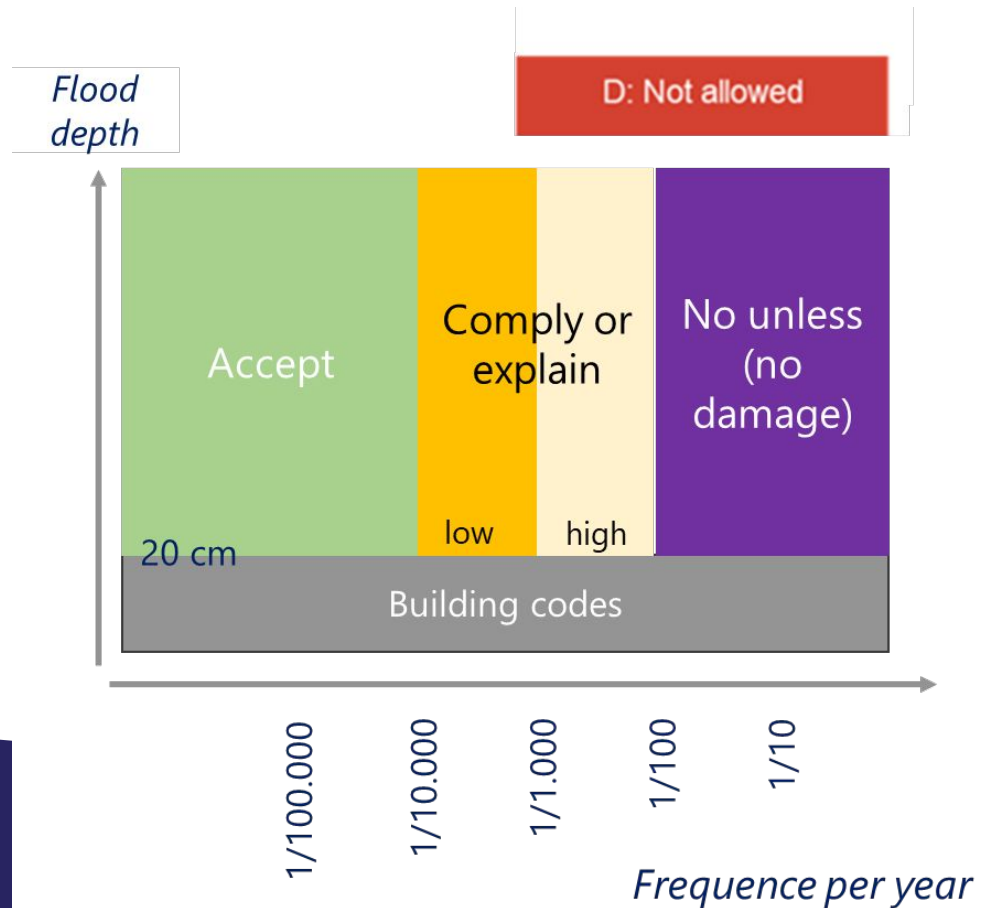

Infection risk per hour for an individual setting

*Courage is needed for experts and decision makers*

# Where and how to build (climate change)

- Additional criteria needed?
- Which climate scenario?
- Sustainable insurance?

# Time line of a pandemic event (COVID)

## Phase 1: Prevent / Fight

Normal day to day life

Detection and forecast

Warning and fighting

Last resort: Lockdown

### Timeline

Start (T0)

Months

1 month

Hospitals

Patient 0.

Quarantine

NL: Smart lockdown

Forecasting systems

China: nov 2019  
(NL: feb 2020)

Warn public

Aim to stop the virus (which succeeded with SARS)

Ventilation

1,5 m distance

Sewer system

Work at home

### RUTTE

Kijk, we weten nog niet alles van het virus. En ik heb het eerder gezegd, we hebben 50% van de kennis waarmee we 100% van de besluiten moeten nemen. En dat is eigenlijk nog steeds

# Time line of a pandemic event

## Phase 2: Disaster

### Timeline

Hospitals	Patient 0.	Quarantine	NL: Smart lockdown	Temporarily full Lockdowns
Forecasting systems	China: nov 2019 (NL: feb 2020)	Warn public 1,5 m distance	Aim to stop the virus (which succeeded with SARS)	Events possible / not possible .....
Ventilation		Work at home		Damage compensation
Sewer system				
SCBA
